Recipe

Cholera infantum

"For a child of one year old use a powder composed of one fourth of a grain of calomel & the same weight of Dovers powder. One to be taken every three hours until the papage assumes a healthy apearance which will not be long. Should some sickness ensue small quantities of charcoal ebanbaid and soda (equal parts) may be given daily as a gentle corrective cathartic should the unhealthy alvine evacuations recur the calomel & Dovers should be resumed."
